START HERE

You cannot make a task AI-proof.

Breaking it into steps helps. Using your own class data helps. Asking for a reflection at the end helps.

None of them stops a student who wants to skip the work.

WHY NOT

Whatever you think AI cannot see, a student can just paste in.

Their last piece of work.

What happened in class today.

The data your class collected.

It takes about ten seconds.

THE REAL DAMAGE

The problem is not the student. It is what this does to the teacher.

Tell a teacher a task is AI-proof, and the first student who gets around it makes them think the whole idea failed. One student skipping the work is a small loss. A teacher giving up on the method is a big one.

A BETTER QUESTION

Do not ask "can they cheat?" They can.

Ask these two instead:

How much work does skipping actually save them?

Would you notice it in what they hand in?

WHAT WORKS INSTEAD

Make doing it properly the easier option.

You cannot block the shortcut. You can make it more effort than it is worth, make the work it produces worse, and make it easy to spot.

No screen-watching. No detection software.

OVERSTEMED

No task here is AI-proof. That is the point.

overSTEMed says that out loud on day one. Promise teachers a magic fix and they stop trusting the training by the middle of the term.

Teachers leave a day with one lesson they are teaching in the next two weeks, rebuilt, and they know why each part of it works.
