OECD · EUROPEAN COMMISSION · 2026

AI literacy is not AI tool use.

The OECD and the European Commission published an AI literacy framework for schools this year.
The distinction is on page five. **Most AI training in schools sits on the wrong side of it.**

IN THE FRAMEWORK'S OWN WORDS

"Simply interacting with AI tools neither develops nor depends on the knowledge, skills or competences detailed in this framework."

Empowering Learners for the Age of AI

OECD and European Union, 2026, p. 5

THE TEACHERS

One in three teachers uses AI. Three in four say they lack the skills to teach with it.

The gap is not access to tools. **It is a staffroom that was never shown how the thing works.**

OECD Teaching and Learning International Survey 2024, cited in the framework

ON LEARNING

Better work, faster. Not more learning.

Students using AI produce better work, sooner. The framework's reading of the evidence: the gains do not hold.

A faster finish is not a deeper understanding.

WHAT IT ASKS OF TEACHER TRAINING

Not the tools.
The teaching.

Teacher training, it says, “should not focus solely on tool use, but on appropriate teaching methods.”
In plain terms: not which buttons to press, but how a lesson changes once the tool is in the room.

Most AI training offered to schools is a tour of the tools.
The framework asks for the reverse.

OVERSTEMED

The framework asks for it. overSTEMed already does it.

Teaching methods first, tools second. That is the framework's ask, and it is how every overSTEMed teacher day is built.

The day opens without screens: how a model learns, why it is fluent and wrong, what bias looks like, with paper and what is already in the room. Then every teacher redesigns a task they teach in the next two weeks.
